*** Implementation ***
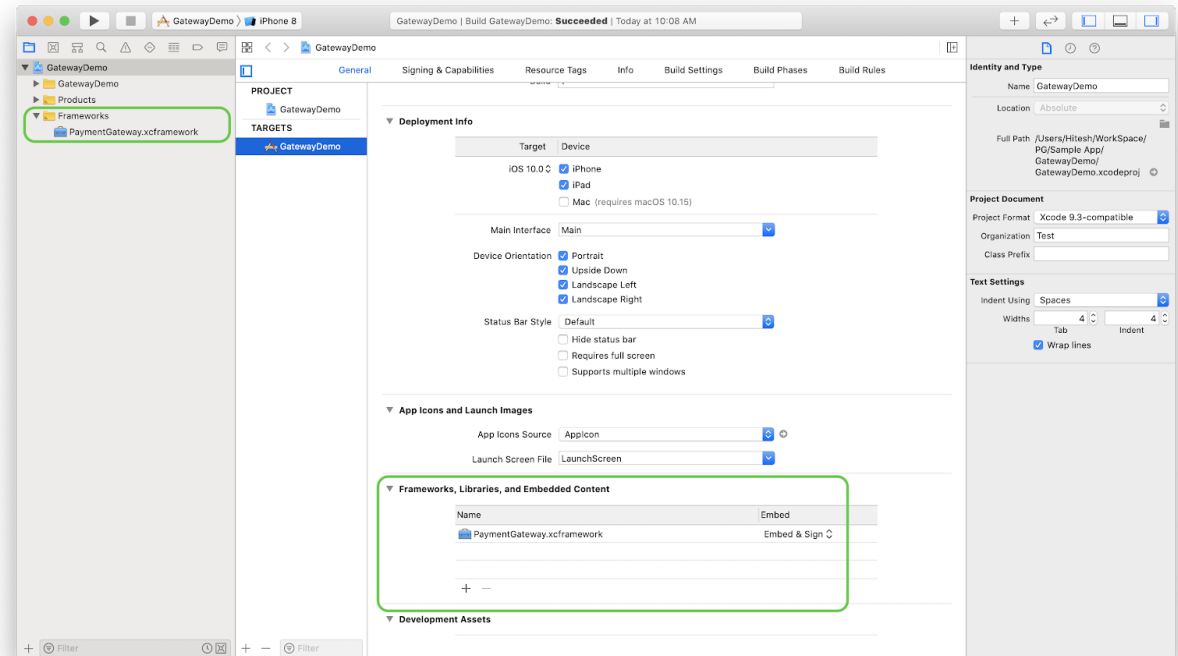

1. Go to tab Project Target > General > Frameworks, Libraries, and Embedded Content. Add PaymentGateway.xcframework there. You can simply drag and drop the gateway's xcframework in the highlighted area. Refer screenshot:

2. Import framework in your code. Like: import PaymentGateway
3. Create a PGRequest instance, which consists of transaction details/parameters in a try-catch block.
4. Then call below method to initiate transaction:
   a. Gateway.initiateTransaction(request: <PGRequest Instance>, delegate: <PaymentGatewayDelegate Conformance>, controller: <UIViewController instance on which Gateway Controller will be presented>).
5. Implement PaymentGatewayDelegate's methods to handle response & errors.

Note:-

1. While creating an instance of PGRequest, amount needs to be in the smallest unit. For eg: if currency is **INR** then set amount in **PAISA**. (For transactions of INR **3.00**, set amount parameter **300**).
2. Consider **GatewayDemo** project as sample reference.
